

Upper Airway Management

Suction only the visible part of the mouth. Remove reachable foreign bodies with a hooked finger (unconscious patient: beware of bites).
 BVM ventilation rate: Adult 10-12 per min. (one every 5-6 seconds); child-infant 20 to 30 per min. (one every 2-3 seconds) (AHA, 2020). Avoid creation of excessive peak inspiratory pressures (COR 3: Harm, LOE C-EO) by delivering each breath over 1 second (COR 2b, LOE C-EO).
 BVM ventilation volume: see adequate chest rise and fall with each ventilation. If possible, favor 4-hand ventilation (2 first responders).
 Assisted ventilation rate: Modeled on the patient's breathing by giving sufficient volume - the patient's collaboration is important, explanations must be clear and gestures assured.
